

BIOL 3427: Plant Science
Quiz 3, 7 February 2008

1. The rootcap is comprised of parenchyma cells that cover the root apical meristem.
2. The tubular extensions of epidermal cells in the root are known as root hairs.
3. The meristem responsible for secondary growth in the dermal tissue system is the cork cambium.
4. The arrangement of vascular tissue in monocot stems can best be described as scattered.
5. T/F: Open vascular bundles in the stem are capable of secondary growth: True.

Other answers were accepted if they were correct, but these were the ones I wanted.
