

# PHYS 1444 – Section 001

## Lecture #23

*Dr. Koymen*

- Gauss' Law of Magnetism
- Maxwell's Equations
- Production of Electromagnetic Waves
- EM Waves from Maxwell's Equations
- Speed of EM Waves
- Energy in EM Waves
- Energy Transport

# Displacement Current

- Maxwell interpreted the second term in the generalized Ampere's law equivalent to an electric current
  - He called this term as the displacement current,  $I_D$
  - While the other term is called as the conduction current,  $I$
- Ampere's law then can be written as

$$\oint \vec{B} \cdot d\vec{l} = \mu_0 (I + I_D)$$

- Where

$$I_D = \epsilon_0 \frac{d\Phi_E}{dt}$$

- While it is in effect equivalent to an electric current, a flow of electric charge, this actually does not have anything to do with the flow itself

# Gauss' Law for Magnetism

- If there is symmetry between electricity and magnetism, there must be an equivalent law in magnetism as the Gauss' Law in electricity

- For a magnetic field  $B$ , the magnetic flux  $\Phi_B$  through the surface is defined as

$$\Phi_B = \int \vec{B} \cdot d\vec{A}$$

- Where the integration is over the area of either an open or a closed surface

- The magnetic flux through a closed surface which completely encloses a volume is

$$\Phi_B = \oint \vec{B} \cdot d\vec{A}$$

- What was the Gauss' law in the electric case?

- The electric flux through a closed surface is equal to the total net charge  $Q$  enclosed by the surface divided by  $\epsilon_0$ .

$$\oint \vec{E} \cdot d\vec{A} = \frac{Q_{encl}}{\epsilon_0}$$

Gauss' Law  
for electricity

- Similarly, we can write Gauss' law for magnetism as

$$\oint \vec{B} \cdot d\vec{A} = 0$$

Gauss' Law for  
magnetism

- Why is result of the integral zero?

- There is no isolated magnetic poles, the magnetic equivalent of single electric charges

# Gauss' Law for Magnetism

- What does the Gauss' law in magnetism mean physically?

$$\oint \vec{B} \cdot d\vec{A} = 0$$

- There are as many magnetic flux lines that enter the enclosed volume as leave it
- If magnetic monopole does not exist, there is no starting or stopping point of the flux lines
  - Electricity do have the source and the sink
- Magnetic field lines must be continuous
- Even for bar magnets, the field lines exist both inside and outside of the magnet

# Maxwell's Equations

- In the absence of dielectric or magnetic materials, the four equations developed by Maxwell are:

$$\oint \vec{E} \cdot d\vec{A} = \frac{Q_{encl}}{\epsilon_0}$$

## Gauss' Law for electricity

A generalized form of Coulomb's law relating electric field to its sources, the electric charge

$$\oint \vec{B} \cdot d\vec{A} = 0$$

## Gauss' Law for magnetism

A magnetic equivalent of Coulomb's law, relating magnetic field to its sources. This says there are no magnetic monopoles.

$$\oint \vec{E} \cdot d\vec{l} = -\frac{d\Phi_B}{dt}$$

## Faraday's Law

An electric field is produced by a changing magnetic field

$$\oint \vec{B} \cdot d\vec{l} = \mu_0 I_{encl} + \mu_0 \epsilon_0 \frac{d\Phi_E}{dt}$$

## Ampère's Law

A magnetic field is produced by an electric current or by a changing electric field

# Maxwell's Amazing Leap of Faith

- According to Maxwell, a magnetic field will be produced even in an empty space if there is a changing electric field
  - He then took this concept one step further and concluded that
    - If a changing magnetic field produces an electric field, the electric field is also changing in time.
    - This changing electric field in turn produces the magnetic field that also changes
    - This changing magnetic field then in turn produces the electric field that changes
    - This process continues
  - With the manipulation of the equations, Maxwell found that the net result of this interacting changing fields is a wave of electric and magnetic fields that can actually propagate (travel) through the space

# Production of EM Waves

- Consider two conducting rods that will serve as an antenna are connected to a DC power source

- What do you think will happen when the switch is closed?

- The rod connected to the positive terminal is charged positive and the other negative
    - Then the electric field will be generated between the two rods
    - Since there is current that flows through the rods, a magnetic field around them will be generated

- How far would the electric and magnetic fields extend?

- In static case, the field extends indefinitely
  - When the switch is closed, the fields are formed near the rods quickly but
  - The stored energy in the fields won't propagate w/ infinite speed

# Production of EM Waves

- What happens if the antenna is connected to an ac power source?
  - When the connection was initially made, the rods are charging up quickly w/ the current flowing in one direction as shown in the figure
    - The field lines form as in the dc case
    - The field lines propagate away from the antenna
  - Then the direction of the voltage reverses
    - New field lines in the opposite direction forms
    - While the original field lines still propagates away from the rod reaching out far
      - Since the original field propagates through an empty space, the field lines must form a closed loop (no charge exist)
    - Since changing electric and magnetic fields produce changing magnetic and electric fields, the fields moving outward is self supporting and do not need antenna with flowing charge
  - The fields far from the antenna is called the **radiation field**
  - Both electric and magnetic fields form closed loops perpendicular to each other

# Properties of Radiation Fields

- The fields travel on the other side of the antenna as well
- The field strength are the greatest in the direction perpendicular to the oscillating charge while along the parallel direction is 0
- The magnitude of **E** and **B** in the radiation field decrease with distance as  $1/r$
- The energy carried by the EM wave is proportional to the square of the amplitude,  $E^2$  or  $B^2$ 
  - So the intensity of wave decreases as  $1/r^2$

# Properties of Radiation Fields

- The electric and magnetic fields at any point are perpendicular to each other and to the direction of motion
- The fields alternate in direction
  - The field strengths vary from maximum in one direction, to 0 and to maximum in the opposite direction
- The electric and magnetic fields are in phase
- Very far from the antenna, the field lines are pretty flat over a reasonably large area
  - Called plane waves

# EM Waves

- If the voltage of the source varies sinusoidally, the field strengths of the radiation field vary sinusoidally

- We call these waves EM waves
- They are transverse waves
- EM waves are always waves of fields
  - Since these are fields, they can propagate through an empty space
- In general accelerating electric charges give rise to electromagnetic waves
- This prediction from Maxwell's equations was experimentally proven by Heinrich Hertz through the discovery of radio waves

# EM Waves and Their Speeds

- Let's consider a region of free space. What's a free space?
  - An area of space where there is no charges or conduction currents
  - In other words, far from emf sources so that the wave fronts are essentially flat or not distorted over a reasonable area
  - What are these flat waves called?
    - Plane waves
    - At any instance **E** and **B** are uniform over a large plane perpendicular to the direction of propagation
  - So we can also assume that the wave is traveling in the  $x$ -direction w/ velocity,  $\mathbf{v} = v\mathbf{i}$ , and that **E** is parallel to  $y$  axis and **B** is parallel to  $z$  axis

PHYS 1444  
Dr. Koymen

# Maxwell's Equations w/ $Q=I=0$

- In this region of free space,  $Q=0$  and  $I=0$ , thus the four Maxwell's equations become

$$\oint \vec{E} \cdot d\vec{A} = \frac{Q_{encl}}{\epsilon_0}$$

$Q_{encl}=0$

$$\oint \vec{E} \cdot d\vec{A} = 0$$

$$\oint \vec{B} \cdot d\vec{A} = 0$$

No Changes

$$\oint \vec{B} \cdot d\vec{A} = 0$$

$$\oint \vec{E} \cdot d\vec{l} = -\frac{d\Phi_B}{dt}$$

No Changes

$$\oint \vec{E} \cdot d\vec{l} = -\frac{d\Phi_B}{dt}$$

$$\oint \vec{B} \cdot d\vec{l} = \mu_0 I_{encl} + \mu_0 \epsilon_0 \frac{d\Phi_E}{dt}$$

$I_{encl}=0$

$$\oint \vec{B} \cdot d\vec{l} = \mu_0 \epsilon_0 \frac{d\Phi_E}{dt}$$

One can observe the symmetry between electricity and magnetism.

The last equation is the most important one for EM waves and their propagation!!

# EM Waves from Maxwell's Equations

- If the wave is sinusoidal w/ wavelength  $\lambda$  and frequency  $f$ , such traveling wave can be written as

$$E = E_y = E_0 \sin(kx - \omega t)$$

$$B = B_z = B_0 \sin(kx - \omega t)$$

– Where

$$k = \frac{2\pi}{\lambda} \quad \omega = 2\pi f \quad \text{Thus} \rightarrow \quad f\lambda = \frac{\omega}{k} = v$$

– What is  $v$ ?

- It is the speed of the traveling wave

– What are  $E_0$  and  $B_0$ ?

- The amplitudes of the EM wave. Maximum values of **E** and **B** field strengths.

# From Faraday's Law

- Let's apply Faraday's law

$$\oint \vec{E} \cdot d\vec{l} = -\frac{d\Phi_B}{dt}$$

- to the rectangular loop of height  $\Delta y$  and width  $dx$
- $\vec{E} \cdot d\vec{l}$  along the top and bottom of the loop is 0. Why?

- Since  $\mathbf{E}$  is perpendicular to  $d\mathbf{l}$

- So the result of the integral through the loop counterclockwise becomes

$$\begin{aligned} \oint \vec{E} \cdot d\vec{l} &= \vec{E} \cdot d\vec{x} + (\vec{E} + d\vec{E}) \cdot \Delta\vec{y} + \vec{E} \cdot d\vec{x}' + \vec{E} \cdot \Delta\vec{y}' = \\ &= 0 + (E + dE)\Delta y - 0 - E\Delta y = dE\Delta y \end{aligned}$$

- For the right-hand side of Faraday's law, the magnetic flux through the loop changes as

$$-\frac{d\Phi_B}{dt} = \frac{dB}{dt} dx\Delta y$$

Thus

$$dE\Delta y = -\frac{dB}{dt} dx\Delta y$$

$$\frac{dE}{dx} = -\frac{dB}{dt}$$

Since  $E$  and  $B$  depend on  $x$  and  $t$

$$\frac{\partial E}{\partial x} = -\frac{\partial B}{\partial t}$$

# From Modified Ampère's Law

- Let's apply Maxwell's 4<sup>th</sup> equation

$$\oint \vec{B} \cdot d\vec{l} = \mu_0 \epsilon_0 \frac{d\Phi_E}{dt}$$

- $\vec{B} \cdot d\vec{l}$  along the x-axis of the loop is 0

- Since  $\mathbf{B}$  is perpendicular to  $d\mathbf{l}$
- So the result of the integral through the loop counterclockwise becomes

$$\oint \vec{B} \cdot d\vec{l} = B\Delta Z - (B + dB)\Delta Z = -dB\Delta Z$$

- For the right-hand side of the equation is

$$\mu_0 \epsilon_0 \frac{d\Phi_E}{dt} = \mu_0 \epsilon_0 \frac{dE}{dt} dx \Delta z \quad \text{Thus} \quad -dB\Delta z = \mu_0 \epsilon_0 \frac{dE}{dt} dx \Delta z$$

$$- \frac{dB}{dx} = -\mu_0 \epsilon_0 \frac{dE}{dt}$$

Since E and B depend on x and t

$$\frac{\partial B}{\partial x} = -\mu_0 \epsilon_0 \frac{\partial E}{\partial t}$$

# Relationship between E, B and v

- Let's now use the relationship from Faraday's law  $\frac{\partial E}{\partial x} = -\frac{\partial B}{\partial t}$
- Taking the derivatives of E and B as given their traveling wave form, we obtain

$$\frac{\partial E}{\partial x} = \frac{\partial}{\partial x} (E_0 \sin(kx - \omega t)) = kE_0 \cos(kx - \omega t)$$

$$\frac{\partial B}{\partial t} = \frac{\partial}{\partial t} (B_0 \sin(kx - \omega t)) = -\omega B_0 \cos(kx - \omega t)$$

Since  $\frac{\partial E}{\partial x} = -\frac{\partial B}{\partial t}$   We obtain  $kE_0 \cos(kx - \omega t) = \omega B_0 \cos(kx - \omega t)$

 Thus  $\frac{E_0}{B_0} = \frac{\omega}{k} = v$

- Since E and B are in phase, we can write  $E/B = v$ 
  - This is valid at any point and time in space. What is v?
    - The velocity of the wave

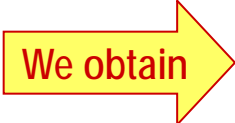

# Speed of EM Waves

- Let's now use the relationship from Ampere's law  $\frac{\partial B}{\partial x} = -\epsilon_0 \mu_0 \frac{\partial E}{\partial t}$
- Taking the derivatives of E and B as given their traveling wave form, we obtain

$$\frac{\partial B}{\partial x} = \frac{\partial}{\partial x} (B_0 \sin(kx - \omega t)) = kB_0 \cos(kx - \omega t)$$

$$\frac{\partial E}{\partial t} = \frac{\partial}{\partial t} (E_0 \sin(kx - \omega t)) = -\omega E_0 \cos(kx - \omega t)$$

Since  $\frac{\partial B}{\partial x} = -\epsilon_0 \mu_0 \frac{\partial E}{\partial t}$   We obtain  $kB_0 \cos(kx - \omega t) = \epsilon_0 \mu_0 \omega E_0 \cos(kx - \omega t)$

 Thus  $\frac{B_0}{E_0} = \frac{\epsilon_0 \mu_0 \omega}{k} = \epsilon_0 \mu_0 v$

– However, from the previous page we obtain  $E_0/B_0 = v = \frac{1}{\epsilon_0 \mu_0}$

– Thus  $v^2 = \frac{1}{\epsilon_0 \mu_0}$

$$v = \frac{1}{\sqrt{\epsilon_0 \mu_0}} = \frac{1}{\sqrt{(8.85 \times 10^{-12} \text{ C}^2/\text{N} \cdot \text{m}^2) \cdot (4\pi \times 10^{-7} \text{ T} \cdot \text{m}/\text{A})}} = 3.00 \times 10^8 \text{ m/s}$$

The speed of EM waves is the same as the speed of light. EM waves behaves like the light.

# Speed of Light w/o Sinusoidal Wave Forms

- Taking the time derivative on the relationship from Ampere's laws, we obtain  $\frac{\partial^2 B}{\partial x \partial t} = -\epsilon_0 \mu_0 \frac{\partial^2 E}{\partial t^2}$

- By the same token, we take position derivative on the relationship from Faraday's law  $\frac{\partial^2 E}{\partial x^2} = -\frac{\partial^2 B}{\partial x \partial t}$

- From these, we obtain

$$\frac{\partial^2 E}{\partial t^2} = \frac{1}{\epsilon_0 \mu_0} \frac{\partial^2 E}{\partial x^2} \quad \text{and} \quad \frac{\partial^2 B}{\partial t^2} = \frac{1}{\epsilon_0 \mu_0} \frac{\partial^2 B}{\partial x^2}$$

- Since the equation for traveling wave is  $\frac{\partial^2 x}{\partial t^2} = v^2 \frac{\partial^2 x}{\partial x^2}$

- By correspondence, we obtain  $v^2 = \frac{1}{\epsilon_0 \mu_0}$

- A natural outcome of Maxwell's equations is that E and B obey the wave equation for waves traveling w/ speed  $v = 1/\sqrt{\epsilon_0 \mu_0}$

– Maxwell predicted the existence of EM waves based on this

# Light as EM Wave

- People knew some 60 years before Maxwell that light behaves like a wave, but ...
  - They did not know what kind of waves they are.
    - Most importantly what is it that oscillates in light?
- Heinrich Hertz first generated and detected EM waves experimentally in 1887 using a spark gap apparatus
  - Charge was rushed back and forth in a short period of time, generating waves with frequency about  $10^9$ Hz (these are called radio waves)
  - He detected using a loop of wire in which an emf was produced when a changing magnetic field passed through
  - These waves were later shown to travel at the speed of light

# Light as EM Wave

- The wavelengths of visible light were measured in the first decade of the 19<sup>th</sup> century
  - The visible light wave length were found to be between  $4.0 \times 10^{-7} \text{m}$  (400nm) and  $7.5 \times 10^{-7} \text{m}$  (750nm)
  - The frequency of visible light is  $f\lambda = c$ 
    - Where  $f$  and  $\lambda$  are the frequency and the wavelength of the wave
      - What is the range of visible light frequency?
      - $4.0 \times 10^{14} \text{Hz}$  to  $7.5 \times 10^{14} \text{Hz}$
    - $c$  is  $3 \times 10^8 \text{m/s}$ , the speed of light
- EM Waves, or EM radiation, are categorized using EM spectrum

# Electromagnetic Spectrum

- Low frequency waves, such as radio waves or microwaves can be easily produced using electronic devices
- Higher frequency waves are produced natural processes, such as emission from atoms, molecules or nuclei
- Or they can be produced from acceleration of charged particles
- Infrared radiation (IR) is mainly responsible for the heating effect of the Sun
  - The Sun emits visible lights, IR and UV
    - The molecules of our skin resonate at infrared frequencies so IR is preferentially absorbed and thus warm up

# Example 31 – 3

**Wavelength of EM waves.** Calculate the wavelength (a) of a 60-Hz EM wave, (b) of a 93.3-MHz FM radio wave and (c) of a beam of visible red light from a laser at frequency  $4.74 \times 10^{14}$  Hz.

What is the relationship between speed of light, frequency and the wavelength?  $c = f \lambda$

Thus, we obtain  $\lambda = \frac{c}{f}$

For  $f=60$  Hz  $\lambda = \frac{3 \times 10^8 \text{ m/s}}{60 \text{ s}^{-1}} = 5 \times 10^6 \text{ m}$

For  $f=93.3$  MHz  $\lambda = \frac{3 \times 10^8 \text{ m/s}}{93.3 \times 10^6 \text{ s}^{-1}} = 3.22 \text{ m}$

For  $f=4.74 \times 10^{14}$  Hz  $\lambda = \frac{3 \times 10^8 \text{ m/s}}{4.74 \times 10^{14} \text{ s}^{-1}} = 6.33 \times 10^{-7} \text{ m}$

# EM Wave in the Transmission Lines

- Can EM waves travel through a wire?
  - Can it not just travel through the empty space?
  - Nope. It sure can travel through a wire.
- When a source of emf is connected to a transmission line, the electric field within the wire does not set up immediately at all points along the line
  - When two wires are separated via air, the EM wave travel through the air at the speed of light,  $c$ .
  - However, through medium w/ permittivity  $\epsilon$  and permeability  $\mu$ , the speed of the EM wave is given  $v = 1/\sqrt{\epsilon\mu} < c$ 
    - Is this faster than  $c$ ? **Nope! It is slower.**

# Energy in EM Waves

- Since  $B=E/c$  and  $c = 1/\sqrt{\epsilon_0\mu_0}$ , we can rewrite the energy density

$$u = u_E + u_B = \frac{1}{2} \epsilon_0 E^2 + \frac{1}{2} \frac{\epsilon_0 \mu_0 E^2}{\mu_0} = \epsilon_0 E^2$$

$$u = \epsilon_0 E^2$$

- Note that the energy density associate with B field is the same as that associate with E
- So each field contribute half to the total energy

- By rewriting in B field only, we obtain

$$u = \frac{1}{2} \epsilon_0 \frac{B^2}{\epsilon_0 \mu_0} + \frac{1}{2} \frac{B^2}{\mu_0} = \frac{B^2}{\mu_0}$$

$$u = \frac{B^2}{\mu_0}$$

- We can also rewrite to contain both E and B

$$u = \epsilon_0 E^2 = \epsilon_0 E c B = \frac{\epsilon_0 E B}{\sqrt{\epsilon_0 \mu_0}} = \sqrt{\frac{\epsilon_0}{\mu_0}} E B$$

$$u = \sqrt{\frac{\epsilon_0}{\mu_0}} E B$$

# Energy Transport

- What is the energy the wave transport per unit time per unit area?
  - This is given by the vector  $\mathbf{S}$ , the Poynting vector
    - The unit of  $\mathbf{S}$  is  $\text{W/m}^2$ .
    - The direction of  $\mathbf{S}$  is the direction in which the energy is transported. Which direction is this?

- The direction the wave is moving

- Let's consider a wave passing through an area  $A$  perpendicular to the  $x$ -axis, the axis of propagation

- How much does the wave move in time  $dt$ ?

- $dx = cdt$

- The energy that passes through  $A$  in time  $dt$  is the energy that occupies the volume  $dV$ ,  $dV = A dx = A c dt$

- Since the energy density is  $u = \epsilon_0 E^2$ , the total energy,  $dU$ , contained in the volume  $V$  is

$$dU = u dV = \epsilon_0 E^2 A c dt$$

# Energy Transport

- Thus, the energy crossing the area  $A$  per time  $dt$  is

$$S = \frac{1}{A} \frac{dU}{dt} = \epsilon_0 c E^2$$

- Since  $E=cB$  and  $c = 1/\sqrt{\epsilon_0\mu_0}$ , we can also rewrite

$$S = \epsilon_0 c E^2 = \frac{cB^2}{\mu_0} = \frac{EB}{\mu_0}$$

- Since the direction of  $S$  is along  $\mathbf{v}$ , perpendicular to  $\mathbf{E}$  and  $\mathbf{B}$ , the Poynting vector  $\mathbf{S}$  can be written

$$\vec{S} = \frac{1}{\mu_0} (\vec{E} \times \vec{B})$$

- This gives the energy transported per unit area per unit time at any instant

# Average Energy Transport

- The average energy transport in an extended period of time since the frequency is so high we do not detect the rapid variation with respect to time.
- If E and B are sinusoidal,  $\overline{E^2} = E_0^2 / 2$
- Thus we can write the magnitude of the average Poynting vector as

$$\overline{S} = \frac{1}{2} \varepsilon_0 c E_0^2 = \frac{1}{2} \frac{c}{\mu_0} B_0^2 = \frac{E_0 B_0}{2\mu_0}$$

- This time averaged value of S is the intensity, defined as the average power transferred across unit area.  $E_0$  and  $B_0$  are maximum values.
- We can also write 
$$\overline{S} = \frac{E_{rms} B_{rms}}{\mu_0}$$
  - Where  $E_{rms}$  and  $B_{rms}$  are the rms values (  $E_{rms} = \sqrt{E^2}$ ,  $B_{rms} = \sqrt{B^2}$  )

# Example 31 – 6

**E and B from the Sun.** Radiation from the Sun reaches the Earth (above the atmosphere) at a rate of about  $1350\text{W/m}^2$ . Assume that this is a single EM wave and calculate the maximum values of E and B.

What is given in the problem? The average S!!

$$\bar{S} = \frac{1}{2} \epsilon_0 c E_0^2 = \frac{1}{2} \frac{c}{\mu_0} B_0^2 = \frac{E_0 B_0}{2\mu_0}$$

For  $E_0$ , 
$$E_0 = \sqrt{\frac{2\bar{S}}{\epsilon_0 c}} = \sqrt{\frac{2 \cdot 1350\text{W/m}^2}{(8.85 \times 10^{-12} \text{C}^2/\text{N} \cdot \text{m}^2) \cdot (3.00 \times 10^8 \text{m/s})}} = 1.01 \times 10^3 \text{V/m}$$

For  $B_0$  
$$B_0 = \frac{E_0}{c} = \frac{1.01 \times 10^3 \text{V/m}}{3 \times 10^8 \text{m/s}} = 3.37 \times 10^{-6} \text{T}$$
