The DFW International Airport, which opened in 1974, received the first phase of a major, seven-year renovation program for its four original terminal buildings. This $1.9 billion project included dramatic improvements for passenger services, including security and concessions, plus the replacement of terminal infrastructure such as electrical, plumbing, ventilation, and other infrastructure systems.

In this presentation, Mr. Garcia, a UT Arlington alumnus, will provide examples of the planned improvements and describe the planning needed to ensure that everyday operations continue without interruption.

Rudy Garcia, P.E. (BSCE '77) has more than 40 years of experience across a broad spectrum of civil engineering practice. Throughout his career, he has been responsible for numerous public works projects, including aviation and roadway reconstruction projects, infrastructure improvements, paving and drainage, and public transportation and other facilities projects.

Everyone welcome. Light breakfast provided. Reservations via the More Information link below.

Location: Rady Room, 601 Nedderman Hall
